Installing contact lenses can be such a routine after a while, it's easy to forget that little installation manual reps give you the first time the lens launches. We all know how to do it anyway, don't we? Choose the right lens, add the right one, and have a more refract. But with Ciba's new launch of Dailies Aqua Comfort Plus Multifocal, which uses exactly the same multifocal design as their original monthly Air Optix Multifocal lens, let's take another look at the appropriate guide because what's inside might surprise you. Here's a link to the Ciba 1) Start with your vertexed power distance and select add based on this traditional scale. Start with the same add in both eyes. 2) Excessive refract at a distance with trial lenses or flippers 0.25 euros/-0.25. Make sure both eyes are open (don't do monocular refractions). Change the power of the lens accordingly - try to press as much plus as possible at this stage without having to overpower the distance vision. Stop. If vision is an acceptable distance and next to binocular vision and good lighting, do without trial lenses. Having trouble with the distance or nearby? Time to take advantage of eye dominance. To define dominance, I like to use a 2.00 euro blur method. Keep 2.00 euros or 1.50 euros for each eye in the distance binoculars. Which option looks better? An eye that can't take plus your dominant eye. If there is a problem with distance: If excessive refraction can't solve distance complaints, it's time to use this dominant eye to our advantage and split

adds. This may seem obvious, but check out that last line of the table. For Hi adds, you have to drop to the middle to add power to the non-dominant eye. Yes, you're reading it right. Shock? I was. I can't say it makes sense, but apparently it should work. If the problem is close: 1) Add 0.50 pounds to the non-dominant eye. This is true before you start messing around with the add, try clicking a little more plus. At the moment, you are sacrificing a short distance in the name of the next. If you still can't get good enough near the view, then from here, split add as described: 2) Split Add: Yes, again Hi add power counterintuitive. You drop no dominant add to the environment. I haven't been able to get a good scientific explanation of why it's weird to add adjustments to Hi adds works, but the mixed zone of multifocal contact lenses can give crazy results. I guess if vision problems we take the eye might not take advantage of some mix of add power, so we try to use a different power mixture to increase visually As we all know, the power of multifocal contact lenses is only a starting point, and many times the final Rx contact lens doesn't match that well with human prescription glasses because multifocal contact lenses are so volatile in the vision they provide. Provide. It's all about how the patient's eye and brain can use the mixed area information it is given. This is why a vision can take a week or two to even reach its true potential; the eye and brain must learn to interpret the lens. So if you want to achieve even better multifocal results, try to go back to the appropriate guides to your lenses. You may be surprised by the suggestions inside! YOUR VARIANT ® 2019 Alcon 7/19 US-DTM-1900012 Menu ® ® Air Optix Aqua Multifocal by Alcon Inc. are the latest addition to the Air Optix contact lens brand. This presbyopic lens system with 3 ADD credentials is designed to successfully prepare and smoothly transition you through the various stages of presbyopia, so you can stay in contact lenses for longer. With a number of innovations such as a new precision transition design and a unique plasma surface treatment, The Air Optix Aqua Multifocal contacts promise to provide superior comfort and fitness. The features and benefits of Air Optix Aqua Multifocal Contact Lenses 30% below the contact angle (compared to Air Optix) increases fitness. For added comfort of wearing, the unique wetting agent (with hydrophilic properties) allows the eyelid to glide easily across the lens. The unique Aqua Moisture System allows up to 5 times more oxygen through the lens than traditional hydrogel soft multifocal lenses. Result: White, healthy eyes. Air Optix Aqua Multifocal provides a smooth transition from close-up to remote vision in real-world situations. The design of the aspheric rear surface provides optimal centering and excellent installation characteristics. The surface of the plasma lens resists sediment, and a unique moisture agent binds to the surface of the lens, creating a more silky layer. Who should consider The Air Optix Aqua Multifocal? Presbyopic patients who experience discomfort due to dryness when wearing contact lenses and for this seek outstanding 24-hour comfort. People who are looking for breathable monthly lenses for healthy and extended night wear. People who want to sleep with their lenses in. People who have refused to wear contact lenses due to discomfort such as dry and itchy eyes. What else do you need to know about The Air Optix Aqua Multifocal?
