Nocturnal sleep EEG correlates in dementia and mild cognitive impairment: a population-based study. To determine whether there are any differences in the frequency of nocturnal sleep EEG abnormalities between patients with dementia and mild cognitive impairment. We studied a sample of 213 subjects from an epidemiological study of dementia in a community-based sample of elderly people (aged 75+ years) living in the greater Vancouver metropolitan area. We used logistic regression to analyze the relationship between EEG power bands (delta, theta, alpha, beta1, beta2, beta3, and gamma) and dementia/mild cognitive impairment (as determined by the presence/absence of dementia and/or mild cognitive impairment, as defined by the Diagnostic and Statistical Manual of Mental Disorders-Fourth Edition criteria). The age of subjects was 85.2+/-6.7 years (mean+/-SD). The sample comprised 78 men and 520fdb1ae7
