The Google Play Store is the safest and most easily accessible place to grab your major Android apps and games. Although it is a fairly stable application, it is not immune to bugs and problems. Google can present a wide range of incomprehensible error codes without a real way to quickly solve this problem. This list of the most common Google Play Store error codes and their solutions should help you get around these annoyances.Common Google Play Store bugs: Error 944 / Error of getting information from server / rpc: s-5: AEC-0 We start with a simple and one of the most common bugs of the Google Play Store. The 944 error occurs when Google Play Store servers are offline, or if they suffer from some connectivity issues. The best solution is to just wait a while and try again rather than messing around with the app's settings. This can be annoying, but if you get this message at least you know there's nothing wrong with your phone! Error 941 / 927 / 504 / 495 / 413 / 406 / 110 / rpc:aec:0 / 492If you had trouble downloading apps from the Play Store, you will probably come across a bug 495, 110, or one of the other Play Store error codes above. They all point to slightly different download problems, but they all have the same solution. To fix any of them, you'll probably need a new Google ID assigned to your device, but it's not too hard to do. First, delete the Data Of the Google Play Store by moving to the settings of the apps and notifications of the zgt; see all the apps of the Google Play Store and the cache of the clear store and clean cache. Check if this has fixed your problem. If not, you'll want to delete your data from Google Services Framework too, which can also be found under apps. This will give you a new Google ID on your devices, almost as if you plant a reset of it. However, this new identifier has the downside to spoil some applications, at least temporarily, so you may have to reinstall any applications that are suddenly having problems. If you still have a problem after that, you'll have to delete your Google account from your device. Do this, and re-add it back after the reboot, over your head over to the settings of the zgt; account to zgt; Google.Error DF-BPA-09/18 Character mishmash above, is another fairly common Play Store code error, this time related to an attempt to download the purchased app. Unfortunately, trying over and over again won't make the issue go away, but quickly clearing the data of the Play Store app will solve it quickly. Just clear data in the general settings of the app and notifications of the zgt; see all the apps of the Google Services Framework ggt; and a cache of clear storage and a clean cache. This problem is sometimes at the end of Google too, so the above method may not work every time. If so, log in to the Google Play Store from your computer and click the download on your device. Error DF-DLA-15 / 8 / 20 / 498 498 497/ 941B is another verbose kind of Play Store error code, but this refers to app updates or new downloads. The best way to get rid of this problem is to clear the cache and data from the Play Store app and try again. To do that, go to The Settings of the Apps and Notifications to see all the apps in the Google Play Store and the cache of the clear store and clean cache. If that doesn't work, try deleting and re-adding a Google account. With these bugs, it can also help destroy the phone's cache section (if it has this feature). To do this, first, turn off the phone. Tap and hold the volume of the key and power buttons for a few seconds. Release the buttons when a smart menu appears. Use the volume keys to go to the recovery menu and press the power button to select recovery mode. (In some phones, just the first step is enough to open the recovery menu directly). Use the volume keys again to go to destroy the cache section. The 103Error 103 error occurs when there is a compatibility issue between the device and the app you are trying to install. Typically, Google does not allow you to install incompatible applications, but sometimes there is a server error or error that can lead to conflicts. The best solution is to wait for this. This is often a server side issue related to application signatures. The Play Store will eventually upgrade to make sure your phone gets the right package. While the remaining problems should be reported to google Support for them to review. Error 919 / 101 / 923 / 921This Google Play Store bug is pretty simple to fix. This simply means that there is not enough space on the device to fully install or update the app. Removing some unused apps is a good place to start and then take photos, videos or music. The 491/923491 error unfortunately means that downloads and updates are not possible, so something went seriously wrong somewhere. To fix this error, you will need to delete and then add the same or new Google account to your device. Go to your device's settings and zgt;, click on your account and then click Delete account. Restart your smartphone or tablet and then return to the settings of the accounts to add your account again to log back into your account. Finally, go to the app's customizations and notifications to the all apps of Google Play's service and storage and cache of clear storage and clean cache. The error 403The 403 error is similar to the above, in that downloads and updates are impossible, for some reason. This time, however, the problem is caused by a conflict between two or more accounts buying apps on one device. To fix this, your first port of call should be to log into the Google account that you bought the app with, delete it, and then press the buy/install button again. If this doesn't work, deleting your search history in the Play Store can eliminate the conflict. To do this, visit the Google Play Store Select Settings to clear the local search history. Also, you can try to create a new Google Play account and install the app again using this account, although this is usually how the problem started anyway. Error 927It is another Play Store error code that appears when you try to download or update an app, but this particular code only happens when the Play Store is caught in the middle of an update of its own. The best fix is usually to wait for the Play Store to finish the upgrade and installation and then just try again. In addition, you can clean up the app's data for the Play Store by stopping by visiting the app's app settings and notifications to see all the apps in the Google Play Store and the cache of clear storage and clear cache. Error 481If you're unhappy enough to see the error code 481, then this is probably the end of the road for your Google account. This code means that there is a serious error in your account. The only fix is to delete the old account and then sign up for a new one. Error 911This download error can be a little harder to diagnose accurately, as it is sometimes a problem with the current wiFi connection, but can also be solved by cleaning up The Google Play Store data. If you're connected to a Wi-Fi hotspot that requires login, it's possible that a 911 bug appears because you need to re-verify the authenticity of your connection. Once you've done that, open the app and try again. If you're still having problems, this is probably something to do with your WiFi network, so try another connection or perhaps switch to a network connection. Alternatively, you can try to clean up the Data Play Store by stopping by visiting the App and Notifications settings and notifications of the Google Play Store and the cache of clear storage and clean cache. The BM-GVHD-06 Errorrths error pops up if you run into any problems when trying to use the Google Play card to buy apps and games. The first thing you need to do is just restart the device and try to use the code again. If the problem doesn't go away, it could be a problem with the play store itself. Click on the Google Play Store's settings for the zgt; Click on Force Stop's click on the Uninstall update. The Play Store will return to the previous version, and the problem should go away. Error 501 / Error Authentication requires These errors to show when the Google Play Store is not downloaded. This is most often due to the problem of account authentication. Closing and restarting the app does the trick for some people. If not, go to the settings of the apps and notifications of the zgt; see all the apps of the Google Play Store and the cache of the clear storage Pure cache. You may also have to go to the settings of the accounts and delete your Google account from your phone. Restart the device, re-start your Google account, and the problem has to go away. There are still a few error codes floating around there. Typically, most of them are related to problems or some problems with account authentication. Most of these can be solved by checking the status of your connection and waiting for Google's servers to catch up, or re-app your account in the Play Store. Also, never discount the efficiency of restarting your phone. Hopefully this little list will solve your specific Google Play Store error code. If you have encountered any different errors or have some fixes yourself to contribute to, please feel free to share in the comments section below. (image credit: StackCommerce) Google Go, also known as Golang, has become a favorite programming language among programmers and developers. With access to the system level, Go provides simplicity and security. If you've always wanted to learn how to code using Google Go, you'll want to check out the Full Learn Code MasterClass Bonus Bundle.And seeing as the popular package has dropped in price to just \$25, there's no better time to snap it. Thanks to a well-designed design, Go is user-friendly and allows programmers to create multi-core programs with ease. What's more, it's specifically designed for multi-core processor computers invented over the past decade. It's a 21st century coding language, and if you're a programmer, it should be in your skill set. So don't miss, pick up this course for just \$25, it's a massive price drop with its rrp \$1,783.99!
