First, your game must be installed on a Mac. Mac computers can detect a DVD inserted, but they cannot read a game that is protected by Apple's own Content Protection system. Any time you try to play a game that has been protected by the system you will receive the message that no disk was inserted, when in reality, the disk was inserted and then removed, which causes the Content Protection system to think it has been ejected. All you can do is restart your computer and try it again. A: You need to check if the DVD is recorded in your MAC. Go to "Users>yourusername>Library>Drives" Check if the DVD is recorded there. Q: Is the stack frame of a nested function guaranteed to be on the stack? If a function has an inner function, the inner function is also a nested function. In this case, is the stack frame of the inner function guaranteed to be on the stack? That is, can it be moved off the stack during the execution of the outer function? Or is it merely guaranteed that the inner function will have the same stack frame as if it were defined without the nested function declaration? I'm specifically interested in this case, though I'm interested in whether it would be safe to assume this, regardless of the inner function declaration. Every time the code of a function is executed, a new stack frame is created for that function. (This is independent of the inner functions.) However, the inner function itself (which is not yet executed) still has its own stack frame. It is possible that the inner function causes another function to be executed, which would change the stack frame of the inner function. Such a function cannot be moved to a different location on the stack though. It is also possible that an inner function causes a function with automatic storage duration to be executed. This would also change the stack frame of the inner function. It is also possible that there is some code that changes the stack frame of the outer function. That code is not allowed to "find" the inner function because it will probably find something else instead. Another possibility is that you can have several nested functions. Each of those nested functions will have its own stack frame. // Licensed to the Apache Software Foundation (ASF) under one // or more contributor license agreements.
