Brusherator v1.5 Brusherator is a small Photoshop tool that lets you create a variety of.Q: Rails authentication with SessionSecurity (Django) I am trying to implement authentication for a simple Rails app that uses the

Django authentication method. I am trying to implement the SessionSecurity framework that is used in Django. What is the preferred way to implement authentication in Rails with a session security framework such as Django SessionSecurity? A: I have implemented session security in my current app. Basically I setup a session store in the db, it uses a cookie and I store the user in the session store. The session store is just a table that contains a user_id and a timestamp. The advantage of using a session store is that you don't need to know who is accessing the session as soon as they login. Note that the session store should not contain any sensitive data like passwords. It should be easy to alter the table schema to store that information. To login I have a simple form on the site that submits the users name and password. If the user is valid then I store the users id in the session store, increment the timestamp and set a cookie. To get back to the site I use the cookie and skip the login form. If the user is still logged in then I will see the user name on the page. If the user has not logged in I will redirect them to the login form and if the 520fdb1ae7
