PUPNow update the PS3 from the memory stickNow for some interesting news, it's pretty much as hard as it gets, the rest of this tutorial is eerily similar, so if you manage to get that far you should be fine. Installing custom firmware To install custom firmware we just replace the PS3UPDAT. PUP file on our memory stick with Kmeaw CFW 3.55, and now you can install .pkg homegrown apps on Playstation 3, you'll see the installation program in the Games section, the installation process is very similar to everyone over the update/installation you're doing on PS3. Once you've done this, you can replace the LV2.pkg at the root of your memory stick with a multiman vX.XX.pkg and perform the same installation process to install a backup manager. Important: Every time you download the console you need to run the LV2 program before running the backup manager so it can work properly, it's a small concession to make for the functionality received with this so its not a big big Don't worry if you forget how it doesn't hurt anything, but your backups won't work, which is a waste of time, so remember that you need to run it once every time you load the console with the intention of playing the game from the backup you did. Now you can install blackb0x or any other homegrown software you get in the same way. Troubleshooting: If you get an error when you upgrade to Recovery Mode1. Turn off the system2.
