Just click the VoiceOver button on top of the iPod shuffle and it tells you.³ You can even use VoiceOver to hear the names of the playlists and switch between them. And if your battery needs charging, VoiceOver tells you that too. VoiceOver speaks 29 different languages. So it can tell you the names of songs and artists in their native language or in whatever language you choose. There's another way to get a good mix of music on the iPod Shuffle: Let Genius do the job. Activate Genius in iTunes on your computer, and it automatically finds songs that sound great together. It then creates Genius Mixes, which you can easily sync with the iPod shuffle.^{1,4} By 1.24 by 0.34 inches (29 by 31.6 by 8.7 mm) (including clip) up to 15 hours of music playback On the control panel device (manages playback, Pause, fast forward, fast-forward, volume) Charging via USB to the computer system or power adapter (sold separately) Fast charging time of about 2 hours (charges up to 80% of the battery capacity) Full charging time of about 3 hours VoiceOver supports 29 languages iPod shuffle not only portable. It is dressed in an anodized aluminum body and has no control buttons (except retention) on the device itself. Playback is controlled by a circuit integrated into the headphones. Fixing problems and replacing parts is pretty simple. No matter what you do, you can't get iPod to turn on. Before you delve into the guts of your iPod, check to make sure that the retention switch is not activated. If the hold switch is turned off, the iPod will ignore any input and refuse to do anything. If your iPod problem so easy to decide, read on. If your iPod doesn't turn on, especially if it hasn't been used lately, you may just have a drained battery. Connect your iPod to your computer or AC adapter and see if something happens. Ideally your iPod would recognize that it was connected to a power source and charge its battery. If it no longer charges, it should be replaced. Replacing the battery requires a solder. If absolutely nothing happens, it is possible that your iPod does not receive instructions because the electronic part of the control buttons is bad. Replacing control buttons requires replacing the logic board (for the headphone jack/headphone jack) or headphones (to control playback). If your iPod does nothing when connected to a computer, the solution is most likely to replace the logic board. Transferring the old battery to a new logic board requires soldering. Your iPod turns on and seems to be working, but when you plug in headphones or speakers, the sound doesn't play properly. It is unlikely that your headphones or speakers are bad, but it is worth fixing them as the source of your problem at the beginning. Try your iPod with a different set of headphones or speakers just to make sure there is a problem with the iPod. The most likely cause of sound problems on iPods is poor audio from the socket. Unfortunately, that jack is constantly attached to the logic board. So you will need to replace the logic board. Other problems that may interfere with the work of your third generation shuffle. Sometimes, reset and recovery will fix the sad iPod. Connect your iPod to your computer and use iTunes to restore your iPod. Restoring the iPod will erase everything on it, so make sure everything on the iPod is stored elsewhere until restored. Sometimes it may be necessary to restore the iPod several times before it works properly. If you're unable to restore your iPod using iTunes, you may find it hard to reset your iPod. iPod Shuffles can be reset by turning off the following procedure: disconnect from your computer (if connected), move the hold switch to a turned off position, wait five seconds, and then move the hold switch to either the right position or shuffle. At this point, the shuffling should be reset. If the iPod recovery doesn't work, the cause is likely to be a problem with the logic of the board. There's not much to troubleshooting here. Basically, the only option is to replace the logic board. One of the good things about iPod Nanos is that their flash memory is almost impervious to the damage from the falling iPod. Replace the logic board with a new memory. The way you control almost every iPod is obvious: use buttons on the front. But it doesn't work with the third generation iPod Shuffle. It doesn't have any buttons on it. There's a switch, light, and the headphone jack on top of the shuffle, but otherwise, the device is just a stick. Teh Teh. The light at the top of the shuffle gives visual feedback that confirms your actions. The light turns green to provide most of the feedback, although it also turns orange on several occasions. Instead of using buttons on the body of the iPod, the 3rd generation Shuffle uses a built-in remote control built into the headphones on (other headphones with remotes also work). This remote includes three buttons: volume up, volume down, and central button. While the three buttons may seem limited, they actually provide a good set of options for Shuffle, since it doesn't have too many features anyway. Use the headphone remote to control the third-generation iPod Shuffle this way: Use the volume buttons up and down to adjust the volume. The state light flashes green when the volume changes. It flashes orange three times when you hit the highest or lowest volume so you know you can't go any further. Click on the central button on the remote once. Status light flashes green once so you know you've succeeded. Click on the central button once as the sound is played. Status light flashes green for about 30 seconds to indicate that the sound is suspended. Double-click on the central button and hold it. Status light flashes green once. Press the central button three times and hold it. Status light flashes green once. Double-click on the central button and then release it. Status light flashes green once. Press the central button three times and release it. Status light flashes green once. To go to the previous track, you have to do so within the first 6 seconds of starting a new song. After the first 6 seconds, the triple click takes you back to the top of the current track. Then, another triple click will get you back to the last song. Press and hold the central button until Shuffle announces the name. Status light flashes green once. This is probably the hardest thing to do on this Shuffle model. If you sync multiple playlists with Shuffle, change the one you're listening to by pressing and holding the central button, and keep even after you hear the artist's name and song. When the tone plays, you can let go of the button. You'll hear the name of the current playlist and its contents. Press the volume buttons up or down to move the playlist list. When you hear the name of the playlist you want, click on the central button once. After following the previous instructions to access the playlist menu, click on the central button and Her. Status light flashes green once. The third-generation iPod Shuffle is the only Shuffle model that is controlled only by a remote control in headphones. The reaction to this model was generally warm, so Apple re-introduced the previous interface of the 4th generation button wheel. On this model, you can use buttons on the iPod yourself or any buttons on the stationary remote control on the iPod Shuffle doesn't come with a guide when you buy it. There's nothing unusual about that. In this age of downloads, it's quite common that most products - especially computers and other electronic gadgets - don't come with printed guides. But that doesn't mean there's no iPod Shuffle guide to show you how to use the device. You just need to know where to find it. Shuffle is pretty easy to use without having to read the guide. After all, there are only a few buttons on it. Below are a description of each Shuffle model, links to articles on how to use the iPod Shuffle, and links to downloading the correct manual for your model. Like the first generation, it's a tiny stick - about twice as high as a stick of gum. But very much unlike the original, or any other iPod ever made, it doesn't have any buttons on its front at all. Instead, you use headphones to control it using a mobile remote. It was an interesting innovation from Apple, but ultimately one that wasn't completely successful or popular. 3rd General iPod Shuffle Guide 3rd gen. iPod Shuffle User Guide (PDF) Learn more about using the 3rd Gen. iPod Shuffle: Released: 2006 (updated 2008) Stopping: 2009 Colors: 2006: Silver, Magenta, Orange, Blue, Green^{2008: Silver, The light green, light purple, red} 2nd generation iPod Shuffle is similar to the 4th generation model, but wider.
