5th Edition. McGraw-Hill/Medical Book Co., New York, 1980. 740 pp. The above entry is a brief description of the text and is intended for individuals interested in purchasing a used copy of the book. To obtain more information about the book and to view the availability of copies, please visit: www.lehninger.org/biochem. The National Library Cataloguing-in-Publication Data for Lehninger Principles of Biochemistry, 5th Edition is available from the NLM. (See also the NLM call no. HD42727 for information about purchasing the text). This book was first published in 1979, and it is being reissued, with only small changes, in a new edition that was published in 2008. It was the textbook used for the medical student program for the first five years of the Medical College at the University of Oklahoma. In the new edition, the section on "Oligonucleotides" has been omitted, as it was not used in the first five years of the medical school. In addition, an introductory section about the biology of humans has been added, as well as a section on human diseases. In some sections of the book, the text has been edited to correct errors, and some new information has been added. This is the classic textbook for the study of biochemistry. It was first published in the 1960s and covers the fundamentals of biochemistry. The text is intended for both students and physicians and will be of interest to anyone who needs a refresher course in biochemistry. This is the textbook that was used for the first six years of the Medical College at the University of Oklahoma and is designed to give a solid background in biochemistry. It covers the topics in biochemistry at a basic level, and it also covers the topics that are of most interest to physicians. The organization of the book is such that the chapters on glycobiology, lipids, carbohydrates, nucleic acids and proteins are followed by a chapter on metabolism, and then the most recent topics are covered, such as proteomics and genomics. This is a revised and expanded edition of the classic textbook, "Chemistry of Life," originally published in 1956. It covers the basic principles and fundamental processes that are required for life and for the production of new living cells. It does not cover any practical chemistry of life or any research in the field. This is an excellent textbook for the study 520fdb1ae7
