Do you have a PDF document but the text is not surfable? You can change this with optical character recognition (OCR) software. Read on for some OCR applications to Mac PDFs. If you have a PDF that is not surfable, it is likely to have been created on an image, such as a scan. While the Preview app on macOS can handle basic editing of PDF files and other documents, it does not have built-in OCR software. Let's look at the two reliable software options below. PDFpen Download PDFpen or PDFpenPro, if you don't have it (free trial available) After installing the app on your Mac, open the PDF document you would like to apply OCR to PDFpen will automatically ask if you want to use OCR on the scanned document Click OCR Document Here's how the process looks: PDFpen supports OCR for 19 languages, use the flags to select those you like. If you don't see an automatic dialog asking for an OCR, click the file → OCR files... Adobe Acrobat Pro Download Adobe Acrobat Pro, If you don't already have it (free trial available) Open PDF with an acrobat that you would like to apply the OCR click edit PDF tool in the right sidebar and the acrobat will automatically apply OCR to your document (it will also be edited) Other options there are many free options that appear in Google's search for OCR PDF Many of these options from unknown developers, and there are risks associated with downloading and using free software outside of the Mac Store. If you just need an OCR a couple of PDSS files, using a free trial of PDFpen or Adobe acrobat Pro will work. If you work regularly with PDFs and need a good solution, PDFpen or PDFpenPro are excellent options with a fixed price of \$75 or \$125 to own the software. In contrast, Adobe has switched to a subscription model for Adobe Acrobat Pro and runs from \$15-\$25/month after trial depending on whether you opt for a subscription for a year or not (\$180/year for just the cheapest). For more help get most of your Apple devices, check out our as a guide, as well as the following article: FTC: We use income earning auto affiliate links. More. Check out 9to5Mac on YouTube for more Apple news: Open the Mac App Store to buy and download apps. LEADTOOLS OCR performs advanced OCR (optical character recognition) on images, extracts text from images and converts images into different document formats with superior accuracy and speed. OCR, extract, copy and paste text from the image for editing and sharing. Transformation and export in various document formats, including: PDF, DOCX, Text, SVG and many others. Other. Control the OCR Engine settings to set up the image recognition method. Developer's Note: This is one of the applications that is provided with source code in LEADTOOLS, an award-winning SDK for programmers. This application, powered by patented machine learning algorithms, is built using the LEADTOOLS OCR engine. This app is designed to show developers some of the many features they can integrate into their own apps using LEADTOOLS. For more information or to download the free SDK rating of our full toolkit, including the source code for this app, visit: your feedback! Please feel free to share it with us at any time on: comments@leadtools.com Sep 10, 2020 Version 3.4.4 Updated to use LEADTOOLS Version 21Speed and Optimizing Precision Use to transcribed jpgs of old newspaper articles where the quality of the text is often not great. Most of the other free OCR apps I've tried to deliver are between 10% and 50% accurate text from these articles. This program is 90% to 95%. Like that it is transcribed from jpgs against first to save as PDFs as certain apps. Not sure what zone functions should do. It may not seem to the unselected zone created by the Autozone tool if I want only a portion of the document translated. The Draw zone tool doesn't seem to work at all. But I found that I didn't need to either. Just hit Recognize after the opening of the document / image and text translated. Then you can cut and pass any translated text you want from the translation window. I used this app to capture text in books that I highlighted and stressed. It's amazing how well it seems to ignore most of that when recognizing a text with more than 95% accuracy. It's not hard to use, but it takes a minute to figure out. The only feature that it doesn't have is that I would like to be able to cut and paste from the app directly into Word, etc. Thanks to devolpped this app. This app really saved my life. Because I've come across PDF documents and because of this application I can open them with in the app I choose a file that I need to conver than I click open than using the Voiceover app tells me how many pages the document is good and useful because let's assume that the document was a 5 page application so friendly that there is a radio button that allows you to download and process 2 pages at a time. But when you go to save the document and you choose the simple text it will open in text editing, which is why when I'm going to toss my PDF documents I'm carefully choosing the right one for the first time. It never always hurts It's an app. Thanks to the developpers for this amazing OCR program for MAC OS10. It was the only app of all the apps that I tried all of them had flaws t, but it's true to say that this app does what it is it says in the description. Very pleased. I compared the other OCR tool I have, and the PDF OCR X ce has made way better on the screenshot of the sample text than my other utility. It was as reasonable a result as a pro product that I used years ago. They though include the ability to comment on the results and include the image you fed it, so you can help them improve the product. I hope that someday they will add a little AI to guess the fixes based on spelling, grammar and context. Maybe in the paid version? Remember, garbage, garbage. The cleaner, the higher the scan res you provide, the more likely the chances of accuracy. PDF files come in different flavors, so if this product can't read yours, try scanning the printout or print it out before the PDF to change the PDF format. If you have been an incentive to try to move to a paperless office, then you are not alone! 2013 is the year going paperless, and it doesn't just mean scanning those old receipts and correspondence, it's completely digitizing them too. In this guide, we'll show you five different applications that can transform the documents you scanned into fully searchable apps using technology called OCR. Update: You can also easily scan documents using OCR technology via iPhone using the new DocScan app on Envato Market.DocScan app on the Envato market If you prefer to use a traditional scanner to scan documents, read on for full information on how to do so. What is OCR? OCR means optical character recognition. Whenever you scan a document, the scanner itself is unable to know what the difference is between text and image, so everything you scan is actually an image. This also applies even if you decide to keep it as a PDF as you won't be able (yet) to choose any text. OCR technology has been around for quite some time, but it's often an understated feature that usually isn't even looked at. If you've bought a scanner in the last few years, chances are you've already had some pretty nifty OCR software on the drive it came with! As Mac users, we are sometimes spoiled by the fact that we almost never have to worry about installing drivers, so software on the same drives is often ignored. Tip: PDF is just a container for text and images, so any receipts or correspondence you scanned and stored as a PDF cannot yet be verified. 1. Prizmo Prizmo is a special OCR app. It is not designed to help you trim or straighten your scanned documents, its sole purpose is to analyze the text scan and convert it to search text. This is not limited to just simple text documents such as receipts and correspondence, Prizmo will even analyze old newspapers and magazines, book covers, almost anything with any form, size and color text is something Prizmo will convert. Prizmo includes the ability to capture scans directly from Image Capture, built-in OS X cameras and applications to import scanners, so you can combined with any existing scanner. You can also import existing files if you've already scanned them. Step 1 When you start Prizmo, you'll either create a new document or open an existing one. Before you go on, this is referring to the Prizmo document, not the one you want to analyze. This can be a bit confusing, but Prizmo can save the scan you did if you ever need to go back and change the text, for example if you scanned the 200-page PDF and noticed some pages weren't properly analyzed in the middle and some text was missing. Keeping your work at Prizmo means you can go back and make any changes as needed. Prizmo creates its own documents so you can go back to them (and edit them) later Select a new document... and you will be presented with a new Prizmo document to start using. Prizmo creates its own documents so you can go back to them (and edit them) later We can either drag and drop file images (JPG, PDF, TIFF, etc.), import from our scanner or even browse the photo library. Step 2 For the purposes of this tutorial, I use an existing document that I scanned using my tablet scanner. It was saved directly as a PDF and as you can see, I can't single out any text. Select an open image file... And select an image to use. Step 3 Once you see the image uploaded, you'll be presented with a familiar layout of the page, complete with page sketches on the left side. Prizmo has an appearance very similar to the Apple Pre-app We have some controls adjusting at the bottom where we can customize the rotation, crop images and more. Prizmo will automatically detect document requirements and make any necessary changes to the settings automatically, but we can always set them up when necessary. Step 4 I'm happy with the default settings, so just click Recognize and Prizmo will automatically detect any text areas and analyze them almost instantly. Prizmo can OCR documents quickly and just as you would draw an area to scan when scanning a document, the same can be done for text areas. Prizmo will try this automatically, but then again, you have complete control. The text you're analyzing is then displayed on the right side of the document. Nothing is saved at this stage. If the OCR wasn't completely accurate, you can go and make any changes. Step 5 Prizmo was 100% accurate with my document, so there is no change for me to make. The document can be exported to a number of cloud services such as Dropbox and Google Drive, or attached to a new Message. Prizmo includes support for a number of cloud services that I'm going to keep my document on my desktop, so I'll choose a file... Prizmo is extremely useful for those who scan documents on a regular basis with any type of scanner. The advanced controls you have access to mean you can fine-tune how The OCR process works instead of relying on fully automatic settings. Learn more about Prizmo. ABBYY FineReader Express is another specialized OCR tool designed specifically for this task, and does it very well. The OCR process is automated, so the only user interaction is the ABBYY FineReader Express story, which document to download and where the OCR'd version should be saved. Instead of creating a new document or opening an existing one, ABBYY FineReader Express has a quick taskbar that opens when you start. This is a quick way to OCR documents with as few clicks as possible. You can convert scanned documents into different formats, and an ace up your sleeve is the ability to OCR spreadsheet and output fully searchable - and editable - such that makes it very tempting for business users. Step 1 Since we already have a PDF, we need OCR, run ABBYY FineReader Express and select Convert to search for PDF and choose the document you want OCR. ABBYY FineReader Express includes a quick taskbar to make OCR easy step 2 That's actually it! ABBYY FineReader Express will tell you to keep the new OCR'd document in place of your choice. Oddly enough, you are asked to save the document before downloading the preview to see if ABBYY FineReader Express has been able to OCR the document properly, you need to cancel saving the document and then keep it out of the menu instead. ABBYY is one of the simplest applications to use when it comes to OCR More about ABBYY FineReader Express. We reviewed the Doxie scanner and software in our previous Go Paperless With Doxie guide, but it's worth mentioning its built-in OCR features again. Doxie incorporates a built-in OCR into its import application, so any documents you scan will be able to be analyzed. However, Doxie does not contain many controls and automates much of the process. Doxie has fewer controls than an app such as Prizmo Step 1 Scanning any document you want OCR and then running the Doxie app, making sure your Doxie scanner is connected. Step 2 Once you have imported the scanned document, you can choose where and how you would like to export it. In this case I will choose a PDF with OCR (black and white). It's best to choose the type of document because it can make sure you use a format that takes up less space. Doxie includes the option of exporting as a PDF or with OCR added Tip: You will often find that many companies send correspondence letters that are in a certain color to keep their branding - I recommend just keep them as to keep the file size as small as possible. Step 3 Once you choose where to save the PDF, Doxie will OCR document and export it. The text is fully searched and does not replace scanning text, instead using a clever PDF function called text overlay. Your document may look the same as it used to be, but good thing. Instead, the text is placed transparently over the text, making it searchable and highlightable. Doxie still retains the look of the PDF, but superimposes text that can be highlighted while the Doxie process is very simple, there aren't many options like a special OCR application such as Prizmo. However, this means that if you are already a doxie user or just do a light scan, then these features may not be very useful to you. Doxie scanners start at \$119 and are available Getdoxie.com. 4. PDFPen PDFPen is a little different from Prizmo because it's not just an OCR tool. It's an all-in-one tool designed to fill, edit and modify PDF files. One of its features is that it can detect scanned documents and perform OCR in one step. Step 1 Is running a PDFPen and it will automatically prompt you to choose a PDF to open. Select a scanned document and click the Open button. Step 2 As soon as the PDFPen opens the document and discovers that it has been scanned (rather than downloaded or generated by a computer), it will tell you if you want to analyze it and digitize the text. You can just work with the OCR tool on the current page or throughout the document. PDFPen is another application designed to automate most of the OCR process specify the language needed and select the appropriate button - in which case I just chose the OCR document. Step 3 Once it's finished, save the PDF. Unlike Doxie or Prizmo, you don't create another copy immediately. PDFPen changes existing PDF files so you can simply save the changes, eliminating the inconvenience of managing an additional file. Find out more about PDFPen. Evernote is an extremely popular note-syncing service that acts more like a hybrid between a note and a laptop. Think of it as having a file full of pieces of information that is always available and always easy to look for. We've reviewed Evernote extensively before here at Mactuts, and I encourage anyone who uses Evernote (or is interested in using it more) to read our article The Taming of the Elephant: Awesome Evernote Tips and Tricks to learn more about it. One of the features of Evernote that is often overlooked and never shown to the user is their automatic OCR service. Yes, any image added to Evernote is scanned for text and added to the note. This runs the server side so add the Evernote document is not instantly converted. Because of the number of Evernote users, it's also not instantaneous. To prevent server problems, all documents that require OCR are in line. There's no way to know when it will be scanned, but it's usually within 24-48 hours. If you're a premium member, it's faster. Step 1 To document, just drag it and add it to a new or existing note, making sure to sync Evernote once you've done it. That's all there is to it. Evernote supports note attachments, and any images will automatically be OCR'd OCR'd Step 2 servers Eventually, Evernote will scan the document and perform OCR. Once that happens, the document will be updated and synced back to Evernote on your device. It took about ten minutes for Evernote's OCR document, which I added (I'm an Evernote Premium subscriber so the times will change). OCR is usually very accurate, but there is no control over how OCR works. This is done automatically without user input or settings. Step 3 You can search for text and, as you can see, the text is highlighted when searching. After viewing the note, it seems to be 100% accurate. Once the document has been OCR'd on Evernote servers, it will search in Evernote and you will be able to export the document as a search PDF as well as Step 4 (optional) If you want to keep the search version of the PDF outside of Evernote, you can click the right mouse button and choose Save the Search PDF As... It's not ideal as Evernote wraps every word with a green box so printing it may not be such a good idea, but it works. While its features are pretty basic, using Evernote as the centerpiece for your paperless office becomes even more popular, so if you want to do the same, then you can cut out any OCR process and just drop the scans directly into Evernote. It will take care of the OCR for you, and since most items will be receipts and correspondence, you will probably have almost no problem with Evernote's OCR service. Evernote is free, with premium bills at \$5 a month or \$35 a year. Packaging There in a number of ways, you can digitize these scanned documents to make their text-search and the cost of using the OCR tool has dropped dramatically. Gone are the days when you got stuck in any application your scanner came up with, now you can use almost any OCR app you want. If you're going to find yourself using not only OCR tools, but want a way to manipulate PDF files, then PDFPen is the best choice. For those who just want a path to OCR, I recommend Prizmo. Even if you have a Doxie, Prizmo gives you more control over how the OCR process works. For those who want very occasional OCR something then get a free Evernote account is the most economical option. Did you try to go paperless? Are you worried about OCR or anything you can find in your digital office? We would like to hear from you as always, to discuss this topic further in the comments.
