zip file by using Dongle. Also available on X-ONE XONE 5 Official support and download from Mi Community. If you have any problem related to this solution, Please let us know about it. Thanks you. Mi Flash Tool Tips: Do not put the USB with the phone. It will void the warranty Close all running apps If there is no USB driver installed on your computer, Install it first.

Download the newest USB Driver and Flash Tool from Mi Community, and install the drivers. Connect your phone to your computer via USB cable and launch Mi Flash Tool. Select the image you wish to install and click "Flash" to install it. Done (1)

Field of the Invention This invention relates to a method and apparatus for removing burrs and sharp corners from a product web. More particularly, this invention relates to a method and apparatus for cutting off sharp corners and burrs on a flexible, thermoplastic product web or a thermoplastic product web having sharp corners or burrs. (2) Description of the Prior Art

Techniques have been developed for reducing the appearance of sharp corners and other angular and rough features in thermoplastic products, such as hot melt adhesive, film, and sheeting, and in particular in extruded products such as hot melt adhesive and film. This is accomplished by forming the product over a hub, by a process known as "coring," that is the process of forming the product by extruding the thermoplastic material into a continuous web, onto a core wire that is essentially a hollow tube having a diameter larger than the diameter of the extruded material. However, this technique does not address the problem of cutting off the corner and burr from the edge of the product, because it only forms the product on a core wire and forms no edge cutting. Machines have also been designed to cut off corners and burrs from products, such as wire and cable.

For example, U.S. Pat. Nos. 4,193,264; 4,244,233; and 4,265,466; and British Patent No. 1,177,193 describe devices for removing burrs from wire. Each of these devices has a cutting blade that is either attached to a rotating disk by an annular channel, or located in a rotating channel, or is stationary and is located in a channel with a rotating abrasive member. A product to be cut is fed through the cutting channel at a 520fdb1ae7
