For example, OLSAT does not assess the ability to read and mathematics. Verbal reasoning - Logical selection, verbal analogies, verbal classification and conclusions. Pictorial Reasoning - Image classification, image analogies and a series of paintings. Figure reasoning - Figure classification, figurative analogies and series of figures. Quantitative reasoning - Series of numbers, numerical output and number matrix. OLSAT includes sections such as identifying similarities and differences, reminding words and numbers, defining words, following directions, classifying, creating sequences, solving arithmetic problems, and completing analogies. The goal of OLSAT is to evaluate the thinking skills and provide an understanding of the student's relative strengths and weaknesses in performing various reasoning tasks. The test is designed to measure your child's ability. It is important that parents practice OLSAT test preparatory issues if the child has never been exposed to concepts on OLSAT. OLSAT is given throughout the United States from metropolitan areas with the highest concentration of parents wanting to prepare their children for the test. It is very commonly used in California's GATE programs. New York and many other metropolitan areas in the northeast and southeast of the United States also manage OLSAT for a gifted admission program. Tips for dealing with the OLSATPhotos analogy in the first part of the line are connected in a certain way. In the next part of the line, find one picture that is in an empty box. At the top, the 2nd image is a combination of the bottom and middle shape in the first picture, and the 3rd image is a combination of middle and upper shapes in the first picture. Thus, at the bottom, the middle and upper forms combined in the same way will be the first choice of response. To solve this problem, think of a rule that describes the connection between the three elements on top. Apply this rule to the missing figure at the bottom. Check the rule with each answer choice. If you choose it, will the items on top be linked to each other just like the items at the bottom? If the rule corresponds to more than one choice, look for a more accurate and specific rule by describing the relationship between the elements on top. As curly analogies become more difficult, tell the child that there will be more than one type of change in this matrix of the puzzle analogy figure. Here are the most common types: a. the numbers remain the same. shapes change the shade or color. Parts are added or removed from the shape. numbers vary in size. numbers move or rotate. shapes become mirror images of each other. numbers are divided in half or twice how OLSAT scored? The OLSAT test uses a total age percentage to measure a child's performance on the test. This score is calculated by assessing how many questions the student answered correctly and then weighs that score against other students of the same age. A child who is 6 months younger than another student will only be assessed in relation to other students of his or her age. Once this calculation has been made, the student test results will report a percentage rating of how they did on a scale of 0-100% relative to all other students in their age group. Each student will receive an age The percent rating is based on the score for the entire test, as well as sub-rating the test in both verbal and nonverbal types of questions. Tips for solving OLSAT1 classification issues. They are similar to analogy issues, except that you have to think about the reason why the elements on top belong to each other in one group. What about all of them that they belong to each other as a unit?2. Check that reasoning (above in #1) with each answer choice - if you choose it, all 4 items belong to each other in the group for the reason you have identified?3. If there is more than 1 element, or if no item matches the elements from above for the reason you have identified, look at the items from above and again to think about why they belong to each other in the group. Other tips for the OLSAT prep1 test. Listen. To complete the sentence questions where the teacher will read the question hint, remind the child to listen carefully-the question cannot be read twice.2 Look at every choice of answer. Consider each answer choice one at a time; Then choose the best one. Sometimes, more than one answer will seem right. In other cases, no answer seems perfect. Choose the best answer from the options offered. Always guess. If you're not sure to eliminate the answers, which is definitely wrong, then take your best guesses. There is no penalty for guessing.4 The practice of filling bubbles (for children K and above. Be sure to practice filling the bubbles completely and using a bubble sheet. Clarity is key.
