In order to continue to use our website, we ask you to confirm your identity as a person. Thank you so much for your cooperation. It doesn't matter what ligands are. If you have six of them, that's the form they will take. It's easy! 4-coordinated complex ions They are much rarer and they can take one of two different shapes. Tetrahedral ions are the ones you are most likely to need for A-level purposes in the UK. There are two very similar ions that usually occur at this level: CuCl_4^{2-} and CoCl_4^{2-} . Copper ions (II) and cobalt (II) have four ions of chloride connected to them, not six, because chloride ions are too large to fit more around the central metal ion. It's not very hard to remember either! The square planar complex Sometimes a four-coordinated complex turns out to be a square planner. There's no easy way to predict that this will happen. The only one you may come across at this level is cisplatin, which is used as an antitumor drug. Cisplatin is a neutral complex, $\text{Pt}(\text{NH}_3)_2\text{Cl}_2$. It is neutral because the 2 charge of the original platinum (II) ion accurately undone two negative charges supplied by chloride ions. Platinum, two chlorine and two nitrogen are in the same plane. We'll have more to say about cisplatin immediately below. Stereoisomerism in complex ions Some complex ions can show either optical or geometric isomerism. @ based on our data, we believe that this issue is relevant to Professor Leipzig's class at UW-SEATTLE. Which of the following complexes or complex ions has geometric (cis/trans) isomers? $\text{Co}(\text{NH}_3)_2\text{Cl}_2^{2-}$ (tetraedara) $\text{Cr}(\text{NH}_3)_4\text{Cl}_2\text{Cr}(\text{NH}_3)_5\text{Cl}^{2+}\text{Pt}(\text{NH}_3)_2\text{Cl}_2$ (square planar)What professor this problem is relevant for? Based on our data, we believe that this issue is relevant to Professor Leipzig's class at UW-SEATTLE. which of the following complexes or complex ions has geometric (cis/trans) isomers. which of the following complexes or complex ions has geometric (cis/trans) isomers chegg
