Check out our #HandTip Stairlift Repair Guide: Bruno Elan Troubleshooting Think you might need a new staircase? LET USA KNOW here Having trouble with your ladder? Mobility123 can help! We are plant trained and certified to serve and maintain Bruno Stairs, Savaria Stairs, Acorn Stairlifts, and Handicare Stairs. Mobility123 technicians can usually diagnose and fix your ladder within 1-2 hours... even if you didn't buy from us. We have a set rate of \$175 for home call service. We do not guarantee that we will be able to repair your stairs on the first visit. However, we stock most parts, so one trip is usually all it takes to get your elevator running properly again. In some cases, we have to order the parts from the elevator manufacturer and it may take a few days to get the said parts. In such cases, we will need to return home with spare parts... An additional fee for a trip of \$100 will apply. In most cases, we can have a ladder technician in your house to repair the stairs within 24 hours. We also provide a 24-hour emergency service as well as weekend calls. Tariffs can be changes for service calls outside of our normal working hours. Did you know that most ladder service calls can be avoided by doing some basic troubleshooting tasks? CALL or TEXT us at 856-528-9366 and explain the issues that you have arisen with your ladder. Often we can help you solve the problem in a matter of minutes. It helps if you have a Make/Model/Serial Ladder handy when calling us. If we can't fix your ladder over the phone, we'll schedule a Mobility123 safe living specialist who will come to your house and do all the necessary repairs. For the ladder repair service Please call us at 856-528-9366 We Are A Local Company, serving New Jersey and Philadelphia During the normal use of your stair lift, chances are it will eventually display the error code or the main batteries to be replaced. While some problems can be easily solved many will require a call service. The guide below is a list of Acorn elevator ladder error codes and what they mean. You can also find our basic troubleshooting guide to common ladder problems helpful. If your elevator is a beep or make a chirping noise it's an indication it doesn't get a voltage charge and needs immediate attention. This beep can occur even when the elevator is not in use. If there is no light or sound from the elevator and you have checked the battery insulation switch, you need to schedule maintenance. For help in these matters, call 866-721-6004. We serve the Northern Virginia, D.C. and Maryland area. Acorn Ladder lift codes model 120/130 Explaining the codes of what they tell you and what to do. Ladder elevators have many features to keep you safe and operational at the same time. If the elevator stops working codes on the elevator can tell you what the problem is. It is important to note the flash codes in the sequence of the letter, then the number. Here are the most common codes for Acorn 120 and 130 stair lifts. C1- This code is normal, it's so you know the batteries are charging. C4- Internal lift batteries are fully charged. All Acorn lifts run away from batteries, household energy comes to charge these batteries. It is normal for C1 and C4 codes to alternate while charging. The elevator can flash the C1, then the C4 and back to the C1 while in battery mode. The C5 charger is connected but not charged. This is a battery malfunction problem and requires a service call. The batteries must be replaced and the lift charging scheme must be checked. C6- Battery fully charged, C6 code is displayed for 130 models and is normal operating code. C7- T700 Power Models charge voltage too low. C8- Power charger voltage is too high. The C9- Fault Charger is connected but not charged. The A1- Stair lifts, the elevator is not parked at the charging station. Code A1 tells you that the elevator is not charging. Move the elevator to the charging point. If the elevator doesn't stop honking, check the power supply. If the power supply is connected to the work outlet and the elevator continues to call for maintenance as soon as possible. The elevator will need to be maintained or the main batteries will lose charge and the elevator will stop working. Normal operating codes. A2- This is a normal code when the elevator rides up with the armrest switch. The A3 is also normal and should be on when the lift rides down using the armrest switch. A4- Normal and just like the A2, the elevator travels in the upward direction, but is shown when using a remote control. A5- Normal and just like the A3, the elevator goes in a downward direction, but is shown when using a remote control. E codes - Specify ERROR and usually a problem that can be easily fixed. The E1- Edge of the footrest safety has been activated in the upward direction, check the bandwagon for obstruction. E2- It is also a footrest sensor, but heading downwards, check the bandwagon for obstruction. The E3- Safety Edge on the wagon was activated in the upward direction. The safety edge is different from the footrest sensor. The safety edge is on the elevator car and wraps around the railway lift stairs. The top edge of the security will have a key switch and a battery switch located at the front. E4- It is also the edge of safety on the carriage, but for the downward direction. This will look like the top edge of the security, but without any switches on the lid. The E5- Seat is not in a normal operating position. Try turning the seat to reset the sensor. E6- T700 Models also position sensor Turn the seat into a riding position and make sure it is locked in place. If the seat has been removed, make sure that The camera is aligned and in the right position. E7- T700 Model Low Battery, move the elevator down and park on the nearest charging contact. The elevator will not move upwards until the E7 code is cleared. The E8- The batteries are low and must be charged. The E9- The key switch lift is in a disconnected position. Check to see if the key switch is on to the position. The function of the key switch is to disable the controls and does not actually remove energy from the elevator and the controller. F codes - FATAL ERROR codes indicate a problem that will require a tech elevator ladder service. F1- Wine relay board, you will probably need a replacement board call for service. F2- A brake malfunction usually requires a service call. Try to turn off the elevator and reset. F3- Engine malfunction call for maintenance. F4- Due to engine malfunction. Recommend service technologies. F5- Battery error, try parking the elevator on charging contact. With the F5 code, the batteries have reached a critical level. Parking the elevator at the charging station CAN charge the batteries and fix the problem. How long it will take to charge the batteries will depend on their age and condition. Battery recharge should not take more than 24 hours. In many cases, the batteries are not recharged and must be replaced by a maintenance technician. The F6- Over limit means that the elevator has passed the normal limit and has passed off. Try the hand winding lift from the end of the track. Before you start again, you need to determine why the elevator went too far. Recommend a service call. F7- OSG or excessive speed governor, elevator should be checked service technician. OSG or Overspeed Governor is a device that tracks the speed of your ladder to prevent it from traveling past its normal high speed. This is a security device that should never be tampered with. F8- Lockout system, try to turn off power and reset the elevator, call for service. H codes - Equipment Malfunction - Lift Will Not Work Requires Tech H1- Multiple Error Codes, Probably SW-1 Security Short on the Ground, requires serviceH2- Multiple error codes SW-2 security short on the ground, requires serviceH3- More than one error occurredH4- More than one error, safety device malfunction lift elevator machine and always must be serviced or repair certified elevator technicians. The Acorn lift works using two ladder batteries. There are many reasons these batteries can stop working and won't charge a fee. The batteries are internal and must be serviced or replaced only by experienced ladder lift technicians who are familiar with the Acorn lift. Transformer/Power Supply Batteries on Acorn 130/120 receive a charging current from external power. This unique transformer has a output of 15VAC 2500mA and is in the style of the plug-in, which also needs to be checked when maintaining the elevator. The transformer problem will cause other problems with the elevator and should be immediately. The Acorn lifts are battery-powered and require a continuous charge supplied by this transformer. Any problems with the transformer will lead to the shutdown of the elevator. Programming remotes Can sometimes need to reprogram the remote control. The sequence for the Acorn 130 program and Brooks remote control is below. Note: The programming sequence for the new 130T700 is different. Tap the control switch at the end of the armrest to run the elevator to the bottom. Once in the lower limit position, rotate the seat until you see the error code E5 and stop. Tap and hold the armrest in the direction downwards and the button down on the remote control until the elevator is a beep. Roll the seat back into normal operating position and check the remote control in the upward and downward direction. TwitterFacebookPinterestLinkedIn, specializing in the repair of the Acorn ladder, we can diagnose and fix any problem with your elevator. We will support the following Acorn chairlift models, manufactured in the UK and sold from 2004 to the current date: we stock spare parts for Acorn lifts and do not require a long-term contract to repair your lift. Contact us for the Acorn chair lift service in Northern Virginia, Washington, D.C., Maryland. For troubleshooting and error information in the error code, try our Acorn stairlift 120/130 guide.
