In the early years of spring and neoprene springs were developed by a number of people including a Canadian company called Therm-o-Lin in the early s. The company was later purchased by a U.S. company called Creative Rubber Products Inc. in the late 60's and in the early 70's the company developed a number of proprietary neoprene products including the line of neoprene spring extensions known as Smart spring. In 1996, one of those products became the spring that launched the Smartspring line of neoprene products. The Smartspring Inflator was a revolutionary neoprene inflation and spring extension device. With the Smartspring, you have the capability of inflating a neoprene floatation device in less than two minutes while dangling over the edge of a pool. The product also allows you to control the amount of inflation that takes place as the spring extends. On initial opening, you are provided with the amount of force that you want to keep the spring extended at its maximum length. If you can control the amount of inflation, you can set the spring to extend only a short distance. This is a great product, but if you don't know how to use it, it can be a real pain to use. Once you get the hang of it though, you'll love it. So it's not the best spring in the world. But I used mine for two years on my second boat, and I still have it, and I always thought that Smartspring had this great product with the pump, and the extension device, and all the neoprene stuff. But then it got bought out by a company out in California who made a bunch of products for like insulation, and neoprene insulation, and insulation, and stuff like that, and the spring was never used for anything, and they were using it for all their neoprene stuff, and I guess it got kind of lost in the shuffle, so I don't know what they're doing with it now. But I know it's been around for a long time. That's kind of what I was wondering. They had a picture of this guy in the advertising material, and I don't know if he was a well-known person or not, or if he was their inventor, or if it was a relative, or what. But he was standing on the pool edge with a spring in his hand, and he was holding it, and he was wearing a 520fdb1ae7
