Scarpa phantom ultra vs guide

I received the email pointing out the error I made identifying the Phantom Ultra as a prototype of the Phantom 6000 in a John Griffith photo stack on Le Droites. Thanks for the head to Will! The way behind the sales hype. Jonathan Griffith photo Of Ueli Stack solo Ginat at Le Droites in early 2010 in a super lwt version of Phantom's single, Ultra. Weight down around 1600g in weight in pairs for 42, where the guide is 1800g and 6000 2000g in that size. This shoe is not currently available in North America, but is found in Europe and England. Over all weight becomes up to an ounce or so more traditional, bench sign, silver bullet load fabric, Trango Extreme Evo Gortex La Sportiva's. With a full gaiter boot and better insulation Ultra offers much more protection in unpleasant, wet, cold conditions. And most importantly, once wet, dries faster than Trango in my experience. Ultra, at 3.5 ounces is lighter in my size 45 and \$30/40 LESS expensive than the Phantom Guide if you can find it. 3.5 ounces per download at a rate of 45. Or another 7 ounces or 198g for a couple. Part of the weight saving uses a thinner and lighter sole/middle single system is also used on the Phantom 6000 and noted in this review earlier. The lace inside the Ultra is the same system that is used in the manual. A slightly different material on the inner Ultra boot for insulation and other gaiter material to strengthen and durability with cramps than the manual. I get better at fit into my Ultra than my Phantom Guides. This may just be the difference in specific boots, although not booting models. The ultra seems to dry out faster as well. Again, it may be a subjective call, but the internal download materials differ between two very similar Scarpa Phantom boots. Making enquiries about these boots, Scarpa NA and several retailers that share Ultra in England gave similar answers: Re: Ultra, Boot is less rigid and less warm than the guide. The salt is very fragile. Sole is not as durable as the Guide. Only the manual is available in 1/2 sizes. I think they're protesting too much. No less stiff or less warm is true from my experience. No retailer wants to carry such a specialized Alpine climbing boot on a full scale that will be sold directly against the Phantom Guide, even if Ultra is \$40. Cheaper. I might even swallow a less durable issue with the soles of the shoe as they are a version of lwt also used on the Phantom 6000. Not a boot I'd use on a lot of rock, but it might well be a good advantage to fall another half a pound off your feet on alpine ice and mixed routes where you'd wear pons anyway. But the only question that matters is important. Ultra and 6000 come with a new super low profile and I think a sticky rubber sole. At least they seem sticky, like Sportiva sticky rubber are available on some of the Trango series. Which Which say a lot. And it wears out quickly. Must be sticky as I can walk the boulder field with them. The Vibram® Mulaz sole, has an edging platform in the sock area and is the newest, super tacky, supertrek rubber. The rear sole profile of these two boots is a huge improvement compared to the sole of Spantik, where you can collapse the foam mid-sole when you flip over your cramp lever locks if you get carried away as tightly you want your cramps. No one can do on Ultra or 6000. Well done Scarpa! But the front of the sole is a super low profile wearing area. I still don't manage the perfect front crampon bail fit (and I use a Petzl guarantor) to keep cramps in one place. It's not a dangerous mind you're just annoying. But don't let anyone tell you that it's a great fit, it's not without any real effort. My pons end up from the centre of the French technique and a decent gap on the inside of the bale. If anyone has the answer to that question, let me know, don't they? And that's what crampon produces needs to be addressed sooner rather than later, because Scarpa's new low profile is the only profile really good improvement compared to anything I think. Light weight single profile boots (Ultra and 6000) are much easier to walk around than even a guide. From 3 boots to date Ultra suits my feet best and the easiest lace for a good fit. Despite the fact that all three boots use a similar lace system and the Guide/Ultra system is

exactly the same. By the way, both the Ultra and the 6000 boots I received this year came with Primaloft and Outdry tags. There may be a reason they seem to dry out faster and get less wet than my guides, but I'm only guessing. Too limited in data to go on. By the spring of 2011, all three were supposed to have all lined up with Outdry at Steck's suggestion, replacing the time-proven Gortex liner. Here's a 12/20 answer from Scarpa's 6000 reader request: Thank you so much for your email. The Phantom 6000 has never been manufactured with a goretex lining so there will be no change in how it is produced for the foreseeable future. Check out the product review: the membrane that it refers to Outdry. Not a huge amount of added information, but I use Mtn Hardware gloves, which if considered again Steck designs and lined up with Outdry all last winter and was happy with them. Obviously someone knew a little about the ascent in the design process. I haven't seen Goretex's glove system do as well. OutDry seems to work exceptionally well. I intentionally fully soaked Mtn Hardware gloves and only got the leather palms wet (which take forever to dry) and my hands were left bone dry inside the gloves. If the boots So good. Gaither? Between La Sportiva Batura and Phantom gaiter the amazing La Sportiva gaiter is better than IMO. It breathes better and fits easier with pants tucked away I found the gaiter guides starting to completely ice up internally and starting to give me cold wet feet like c mlted lower in the trunk in cold windy conditions (-7C and below) in Canadian ice fields last week. The moisture from my sweat doesn't come out of the trunk fast enough. In the same place and temps Batura was solid, warm and dry for the most part. The easy fix is simply wearing pants over the shoe (Steck photo above) which keeps everything defrosted and booting your breath better. But I liked Batura's option of making either pants or out. This option removes the material from the lower leg. Less chatter to catch the pon on. An icy inner gaiter on the guide that is now soaking my sox. I haven't seen many reviews about these boots and have only used them a bit myself so take my comments with a grain of salt here. This shoe was a full year on the feet of a climber. I believe in Scarpa's professionals. at least some very good climbers, most of all European and British bad ass. I try a lot of different boots and don't always climb into what I really like because of it. My feet are hard to fit as well. But I actually buy my own boots, so it's not some kind of hoax I'm spewing for a gift. And in this case it took a buddy making a great effort to actually steam me out of Europe because they were unavailable to me in any easy way here. I have one pair of guides and one pair of ultras so the comparison may just be between different boots not between different models. The ultra seems to have a larger heel box and a narrower heel fit. Internal download materials are different. Closer and more convenient for me with Ultra. From the box they walk well and rise well on steep water ice. More than enough ankle support for prolonged bouts of alpine ice. I hardly mentioned the boot on my leg, which is a good indicator for me of how much better they fit than the guide and the difference the new middle sole does to walking. I don't have a huge base of experience in leadership or Ultra... too early for this, but I have enough download experience to make these comments. I had a huge case of buyer's remorse on Ultra as even I can't justify the \$500 per 7 ounce difference over a couple of guides that are easy to purchase and try locally. But it only took me a few minutes, just trying to ultra indoors to know that there was a difference enough for my legs and worth the effort will be passed to get them to me... Thank you Again Will! Walking and climbing in them only strengthened that primarily over the whole impression. Warning. Few modern mtn boots can be riddled as tightly and reliably as the newest Phantom line.... all three of them. Easy to have Operator and more tighten the boots on the bottom or top and cut off the circulation. For me I want to point out that the fact in the download review should give you an idea of how easy it is to do so. This series of downloads exceptional, but like any outfit you will need to find out what works and what doesn't work for you. Lace Dyneema, by the way, are good. You won't break them... Never.... Suspect. SCARPA have announced that they have teamed up with OutDry in order to make my all-time favorite technical climbing boots even better. OutDry waterproof breathing technology will appear in the ScarPA Phantom collection for spring 2011. Both SCARPA and OutDry worked with renowned climber and high-speed climber Ueli Stack on the design of the new Phantom collection. Stack wanted a technical climbing boot with improved waterproofness that would reduce the wet weight of the boot while climbing in sleet. OutDry is currently used in gloves from Mountain Hardwear and shoes from Lafuma among others. OutDry uses 3D lamination technology to stick a windproof and waterproof breathable membrane on the inside of the outer layer of shoes, boots and gloves. Permanent membrane communication creates an impeccable fit without folds, stitches or requirements for the press to seal the seams. The waterproof breathable membrane will be laminated directly on the inside of the K-tech boot top on the SCARPA Phantom technical climbing boots. Using OutDry in boots also allows the addition of Primaloft to improve the quality of insulation. OutDry will be introduced in all new SCARPA Phantom styles, including the Phantom 6000, Phantom Guide and Phantom Ultra.
