The present invention relates to a rod holder of the type that a rod-like member, such as a stringed instrument, is secured thereto. A stringed instrument, such as a violin, is constructed so that a stringed portion is curved, and a hollow body portion is cylindrical. In accordance with a recent constructional improvement, the hollow body portion is formed into a configuration so as to have a bottom hole portion. Therefore, a player cannot see the configuration of the hollow body portion. Accordingly, the player has a difficulty in keeping the finger in a predetermined posture. To avoid this difficulty, the stringed portion is fixedly secured to the hollow body portion. However, when a string is wound on a finger of the player, the stringed portion may come off from the hollow body portion. As a means for solving this problem, a holder has been proposed which is located at an intermediate portion between a stringed portion and a hollow body portion. This holder is usually constructed so that the hollow body portion is formed to have a bottom hole, the holder is fixed to a hollow body portion, the holder has a substantially flat portion for inserting a portion of a stringed portion therethrough, and the substantially flat portion is bent to have a concave shape at its lower end. When a string is wound on a finger, the string is guided through a small opening formed in the concave portion and is prevented from coming off the holder. This holder has been popularized for use in the technique of applying a heavy string to the stringed portion so as to secure the stringed portion thereto. The heavy string is applied, while the finger is restrained in a predetermined posture. The holder constructed in this manner suffers from a disadvantage in that, when the stringed portion is loosened, the holder moves upward so that the concave portion thereof may be brought into contact with the finger. This may result in harmful interference with the finger. molecules-24-00387-sch014j 520fdb1ae7
