EcciVet™

An innovative compounding vehicle

EcciVet™

Animals have therapeutic needs that are not always met with available commercial medication. This is especially true when a prescribed drug is not registered or the animal refuses to take the prescribed medication. Cats, for example, are notoriously picky when it comes to taking medicines. In these cases, compounding can be used to cover the veterinary medical needs.

EcciVet™ can be used with non-hazardous Active Pharmaceutical Ingredients (APIs). To reduce risks, always wear gloves when handling the product.

Unique mixture

EcciVet™ is a unique mixture of excipients for the preparation of capsules. It can be mixed with APIs and flavors, allowing the veterinarian and pharmacist to prepare compounded capsules.

After opening the capsule, few drops of water will transform the content into a meatball-like form, which will simplify the administration of the medicine.

Example formulations¹

Amitriptyline HCL in Eccivet™

Fenbendazole in Eccivet™

Cimetidine in Eccivet™

Clomipramine in Eccivet™
