Brandy Alexander When you turn on the image with text on your web page, the default style displays the graphic above or below the surrounding content, leaving a white space to the left and right of the image. This wastes space and makes the image look disjointed from the text. To fix this, you have the option of using either HyperText Markup Language (HTML) or Cascade Style Sheets (CSS) to indicate image positioning so that the text wraps around the image boundaries. Use HTML or CSS to move text around images as you prefer. Start the page file in the middle's text editor program and spread the cursor inside the tag Enter Align and follow it with quotes as such: Enter right, left, middle, top or bottom after aligning the entry to indicate where your photo appears in relation to the text. The top-up alignment makes your content appear at the highest point of the image, the middle moves the text to the middle of the photo, and the bottom directs the content to start at the bottom of the picture. In addition, the right position moves the data to the left of the image, and the left alignment places the content to the right of the image. Read the code as follows: Place the cursor inside the tag and style with a set of quotes in front of the last corner bracket. To illustrate: Enter swim: inside quotes and enter the attribute left or right to call the alignment of the chart. The value of the left makes your photo appear on the left and moves the text to the right, while the right attribute does the opposite. For example: Reader Gina (not to be confused with Gina's editor) needs a Windows- or Mac-compatible HTML editor who can handle cascading style sheets. NVU is the only open source editor I know of, but its CSS capabilities are notoriously poor. Is shelling out big bucks for Dreamweaver my only option if I want to use CSS on my pages?no. One option is HTML Kit, which supports CSS. Of course, our brilliant readers can probably recommend even more open source solutions. Put them in the comments, people! A free Windows HTML Kit webpage editor is a complete alternative to the expensive website... More What is a web page without photos?? Now we've inserted some new tags, and jazz our page with pictures! Yay! &lt;img src=insert the image url here! alt=insert the image url here! it's the source of where you get the picture from. Tell me I wanted a picture of a dog. I'd put the IMAGE URL, so that's like this: zlt;img...img' gt; this inserts an image of a dog on my You can see the dog in the image area! It's not necessary on a web page, but if someone can't see the image, the alt will explain the picture. In addition, for blind people who are A computer system that reads a page for them, the system will read the viola to explain the picture. So... alt'Cute dog with big, beady, brown eyes now a very simple part. This tag just resizes the picture. So the width will now be 230 pixels! So here's our full tag: zlt;img src' ... alt= cute= dog= with= big.= beady.= brown= eyes= width=230&gt; Yay!! Hello everyone on instructables :) Lately I've been trying to make some websites and post them online just to see how HTML and CSS I've learned worked so I can make a full site involving and reviewing the game in the near future. In testing and improving/improving my skills, I decided to make a website that shows instructables I personally loved from www.instructables.com. I've tried to implement many methods to make the site more interactive. I added a sticky footer that fits on the screen and then many drop-down lists and some hidden menus. It also has support through which any browsing website will be able to send us ideas/complaints about the website or for featuring new projects etc... This feature of sending responses to the website owner's email is a bit tricky because it involves using PHP and other server script languages... The rest of the features are based on HTML and CSS. This makes it a lot easier for new people to start working on building their own websites by code, rather than using websites like www.webs.com etc just like I started when I was 12, but the best part is that you can create an entire website just using HTML, but CSS adds a lot of interactive elements to the website. I am now 15 years old, so I started studying programming about 3 years ago. The text that was used on the website was done using Photoshop and some other image editing programs. I used about 3-4 of them, but I found Photoshop to be the most convenient. What did you do? I made a website that is fully functional, and as soon as I get my computer back up and running I'll start hosting it online. Everything is ready and ready to be hosted, but my hosting computer is not working as I use it to host other things as well such as Minecraft servers. This is a website that demonstrates the basics of web design as I know we can get into much more advanced programming techniques that make very good websites. How did you do that? I've always been interested in programming and electronics. When I saw a lot of really well designed and very good look I just knew I had to try to make one myself. To encode a website I've used programs such as Microsoft Front-page and Microsoft word, I have, however, enjoyed using the first page much more than a word like zlt;with makes it a lot easier for non-professionals to start creating websites as it points out some common code errors and the colors of different texts in different colors to separate coding from writing, etc... My computer techie at school also helped me a lot by teaching me new things like how to adjust shapes/sizes/orientations of various drop down boxes and shading effect, etc... Where did you do it? On my computer in my house. Sometimes I worked on it at school, and when I had time. What have you learned? By creating this site I learned a lot of things I learned how to put the coding I learned to use, and I learned how to combine bits and pieces of HTML and CSS coding I learned at school and online. Before making this site I was always unsure if I could make a website and be able to host it online as I wasn't sure how anything I learned would add to give me a successful result. Now I'm much more confident about building websites and can start by creating factual, serious and good websites by using this as a start :) One of the biggest surprises I encountered after I finished doing the whole website I found out that I didn't include support for use in other browsers like Google Chrome, Safari etc, as when I worked I only used Mozilla Firefox for testing... because of this I had to go through more code and learn a lot of other things to make sure the website worked on Google Chrome and other browsers. I also did instructable about a year ago on the basics of website coding and creating when I first started learning html code and CSS, so look at it for the full basics of web design, but to create more advanced websites you need to learn more in-depth and detailed CSS and JavaScript coding... that I hope I'll start learning soon. Hope it inspires people to start making their own websites and showing off their creativity and talent. THE HTML code for page 1!--Each step of the instructable in contained inside an article tag, this is just to group the steps in their own tag and for organization goals--!--Has 5 main div elements. The header, navMenu, Info, Body, Footer.----Linking to style DOCTYPE html PUBLIC -//w3C//DTD HTML 5.0/EN&gt;&lt;html&gt;&lt;!--\*\*\*\*\*&gt;&lt;div id=navMenubackground&gt;&lt;div id=navMenu&gt;&lt;ul&gt;&lt;li&gt;&lt;a href=#&gt;Материалы&lt;/a&gt;&lt;ul&gt;&lt;li&gt;&lt;a href= hash=item20bd1bed7b target=\_blank&gt;Ципн связ&lt;/a&gt;&lt;/li&gt;&lt;li&gt;&lt;a href= target=\_blank&gt;Припой&lt;/a&gt;&lt;/li&gt;&lt;li&gt;&lt;a href= target=\_blank&gt;Фитиль&lt;/a&gt;&lt;/li&gt;&lt;li&gt;&lt;a href= target=\_blank&gt;Электрическая
