

Multi-Factor Authentication & Data Gatekeeping

PERSONAUTHENTICATION™

YOU ARE TRULY ONE OF A KIND.

PersonAuthentication™ utilizes Multi-Factor Authentication (MFA) across multiple layers and multiple forms in a seamless and extensible manner. It is agnostic to application environments and can recognize any combination of possible forms of Identification – including Facial, Voice, Iris, Finger Print, Biometrics, GeoMapping, RFID, Government ID, Barcode, QR Code and more. It also supports advanced Role Recognition enabling data administrators to manage, track and control every piece of information each user has the authority to access, view and interact with.

For each individual user across every connected application, we create a Truly Unique Identifier (TUI) that significantly enhances security and privacy.

PersonAuthentication™ provides a modular access protocol that combines multi-form factors to manage all user activities and transactions, strengthening authentication by streamlining a much more robust login process and reducing the risks of reliance on password and security question practices.

791 Technologies™ PERSONAUTHENTICATION® becomes the transaction authentication gatekeeper of data at every transaction point to prevent mass cardholder breach and privacy breach, a holistic multi-layer approach of data lifecycle management with elastic security as data sensitivity increases.
