ABSTRACT

The design and development of a Teachers Portal through a centralized web-based system for faculty information and academic management is presented in this thesis. The system aims to provide administrators and faculty members with a unified platform for efficiently managing, organizing, and accessing teacher-related information and academic records. Through the web portal, registered teachers may update their personal profiles, manage class schedules, submit reports, post announcements, and access important institutional updates in a structured and secured manner. The system also enables school administrators to monitor faculty workload, track certifications, and generate reports with ease. Web technologies were utilized in the system's development to ensure responsiveness, usability, and accessibility across multiple devices and platforms.

Keywords: *design and development, teacher's portal, web-based system*
