Dreamweaver 2020 tutorial pdf

Learn the basics, or refine your skills with tutorials designed for inspiration. The question is: There are tons of different tools and platforms that you can use to build your website. Some are more budding friendly than others. But, regardless of your level of experience you will be able to find a site builder that is perfect for your needs. If you've never heard of Dreamweaver before this app is from Adobe that lets you design, build and deploy websites. Even if you've never touched any code before in your life, you can make Dreamweaver work for you through an intuitive visual interface. Below you'll learn how to get started with Dreamweaver. You'll find out what Dreamweaver really is, making it stand out, and finally how you can create your first site using this tool and upload it to your server. What is Dreamweaver Dreamweaver is a website building software that has been around for over 20 years. It was first developed by Macromedia and then acquired by Adobe in 2005. The software has gone through several iterations and is now part of adobe Creative Cloud Suite. This means that you will need to purchase a monthly subscription in order to use the software. Simply put, Dreamweaver is a software that allows you to build, design and publish websites. It's a native app when it means you install it on your computer or Mac. This flexible application is that you can build your site entirely through a visual editor, or exclusively using code. You can also use the two together (assuming you know the basics of coding) to see how each affects the other. It also supports the wide range of languages needed to create any type of website, such as HTML, HTML5, CSS, PHP, JavaScript and jquery. You can use and edit files that are in other languages, but code support features won't be available. Highlights of Dreamweaver in general, Dreamweaver helps simplify the process of designing and building your site. Being flexible enough to address both beginner and advanced market levels. Here are the main features that make this tool stand out: 1. Easy to use the visual interface of the visual interface editor is probably the main feature you'll use when you're just starting out. This is similar to what other novice builders offer in terms of resistance and falling functionality. In addition to this builder, you will choose items with your mouse. This makes it easy to build the foundation of your site in record time. While you do this Dreamweaver will automatically create the necessary code for Then you just upload these files to your server and your site is ready for the world. 2. Built-in code editor In addition to the ability to build your site completely with a visual editor you can also use a code editor to build your site or make changes to your website Design. The code editor is a novice friendly and has some useful features to help you code faster and find out what's going on at the same time. This makes it useful for beginners to see how the code and design interact as you place different elements of your site. As you write the code you will also see visual side changes as well. So you don't need to browse your site to see the changes you've made. Everything happens automatically! In addition, it has features such as completing code that will make suggestions for the code you are currently writing based on your current design. It also has a code collapse feature that will compress parts of the code when you are not currently editing, so you can find what you are looking for much faster. 3. Part of the Creative Cloud Suite If you're already familiar with Adobe products, you'll feel at home using Dreamweaver. Even if the commands will be different than, say, a tool like Photoshop. The layout and interface have consistency in all directions. So, if you love Adobe products and already use the tools in the rest of their creative package, then this builder can be a solid investment. The pros and cons of Adobe Dreamweaver Dreamweaver offer you a lot of possibilities. It would be almost impossible to break all its features here. But here are some of the unique benefits that Dreamweaver offers, as well as a few reasons you can stay away and find another site builder. Dreamweaver Pros Dreamweaver is an intuitive and flexible tool that does a lot of things right. Here are some of the biggest benefits this software has to offer you: Testing devices with Dreamweaver, you'll have an instant preview option that lets you check and see how your site will look through any device. Many other tools have this feature. But, with Dreamweaver, all you need is one click to browse and customize your site on the fly. Easy to test code errors When you set up your code or write it from scratch, there will be errors that accumulate over time. With Dreamweaver, you can quickly find and correct these bugs quickly. Instead of guessing and fixing the site for errors, you'll know what happened and how to fix it. Included font design choices for your site can be a lot of fun. Especially when you start tweaking things like color, layout, font selection, and more. Dreamweaver has a massive selection of fonts built right into the software. This makes it easy to find the perfect font for your blanks and body text. Bundled Stock Photos If you've ever posted anything online, you know how long it can take to search for photos Stock. Instead of searching through various stock photo websites you can do it right within the tool. There's a massive selection and you'll be able to find the perfect photo for your needs. Personalization of the Interface Start using Dreamweaver you can be overwhelmed with all the different tools and options. But, you can actually streamline the look and use of the builder's site by changing your preferences. Once you know what you are using and that you can't create the look of a builder according to your needs. Dreamweaver Cons However, Dreamweaver is not perfect. If you're not willing to invest in the work of learning how this software works, you might be better off with a different solution. Here are some of the biggest drawbacks of Dreamweaver: Steeper Learning Curve there are other solutions for site builders such as Squarespace, Wix and WordPress that make it incredibly easy to build your first site. Creating a basic site and getting it online with Dreamweaver is not too difficult, but creating a site that can do exactly what you want will take some time. Since you start with a blank canvas the end result will depend on your own creativity and skills. Some users prefer this, but others would prefer a simpler solution that requires absolutely no coding skills. You can do a lot with Dreamweaver, and many experienced developers prefer to use this software for the flexibility it provides. Fortunately there are many tutorials available online so you can grow your skills quickly. But, it will take some time and initiative on your part. Your website is only as good as your skills below you will learn how to create a very simple and simple website. You don't need any coding skills to get started, just being able to understand the basics of what you're doing. But, if you want to create a site with lots of extra features, then you'll need a basic familiar and level of comfort with the code to help you get there. Also, if something breaks, then you need to know how to fix them. Or at least troubleshooting until you can solve the problem. With Dreamweaver, you are limited only by your knowledge of the software and your ability to code. You can grow these skills over time. But, if you need to get a website online quickly there are better options out there. A recurring subscription fee (on top of hosting) to access Dreamweaver you will need to pay a monthly subscription fee. For those who build multiple sites, or love the software, this cost is not a head meow. But, if you're trying to create a website on a budget, you can find a cheaper solution. You will have to consider not only the cost of the software itself, but also the monthly fees that you will pay for hosting, and the annual fee you will pay for the domain name. How to use Dreamweaver website from scratch Now that you understand the basic features of Dreamweaver it's time to show them off in action. We won't cover all the tool functions below, but enough to give you a solid foundation to work with. You don't want to handle every aspect of your site's design yourself, it's recommended to use for beginner CMS like WordPress, or another site builder. With that being said, it's time to jump in! Follow the steps below to create and publish your first Dreamweaver website: 1. Choose your plan and install the first thing you need to do is buy and install Dreamweaver software. So, take the Adobe website and choose a plan that works for you. Only one app currently will cost you \$20.99 per month. Whereas, if you want access to the entire Creative Cloud set, you'll pay \$52.99 per month. There are also discounts for businesses, teachers and students that are available too. Once you have chosen to subscribe download Dreamweaver and follow the instructions that come. It's a simple process that only takes a couple of clicks. Also, if you don't want to pay for this software right out of the gate you can choose a seven-day free trial. This will give you some time to play around with the software to see if it's right for you. If you already have Creative Cloud installed on your computer, select Apps and select Dreamweaver CC from the list. You'll be able to free a trial or purchase the software right away. 2. The initial setup and step-by-step guide After installing Dreamweaver software will automatically open and you will see a screen that looks like the one below. Next, choose an option that says: No, I'm new if you haven't used the software below. This will help you through the initial process of creating your Dreamweaver workspace. On the next screen, you'll be able to choose the option that's best for the workflow. Since this is your first time using Dreamweaver, choose the Standard Workspace option. This will allow you to use a visual editor or code to create and customize your site. Next, choose a color scheme for your editor. It's not super important, so just choose whichever color range you like the most. On the next screen, you'll be able to choose if you want to start with a sample site, an empty template, or watch some tutorials. For this section of the tutorial we'll use Start with a new or existing folder, but if you choose the option to start with a sample file you'll have the main base of the site to work with, which looks like the image below. Some people may want to start with a basic template because it's less intimidating. But for those who want to continue to build their sites from scratch and learning all in and out of this tool, then this section of this tutorial is for you. If you want to use one of the starter templates to build your site, not from scratch, and then move on to the next section of the tutorial. 3. Create a new site to start your new site from scratch go to the site of the new site. It should look like the screen below: Here you want to give your site a name and specify the place where your site's files will be stored. Make sure you specify a folder where you'll have all your web projects, as this will make the organization (and then the download to the server) much easier. Next, you want to create an image folder where all the images of your site will go. This image folder should be located in your site's folder. Click on the Advanced Settings button, and select Local Information in the options list. Here you'll select the image folder you created a minute ago. Then click Save and you are ready to start building your site. 4. Create your first page The first page that we will create will be your home page. To do this, select the New file and then select HTML from the document type list. Then name index.html. This will help give your site the proper structure. Now you have to have an empty window like the image below. This is what your site now looks like! You'll also see that Dreamweaver has created some original HTML as well. 5. Create your website headline The first thing we're going to do is create your own headline site. This is the top of your site, which usually includes your logo or the name of your website. To do this, click on the top of the page (you'll also see the item highlighted in the code section below). Then click on the Insert button in the top right corner and select the Headline option. You may have to scroll down a bit to find an option. All the options here are different HTML items you can add to your site. This insert is a header block on your page so you can customize it to your liking. Next, we'll add the H1 tag to this title element. This is important for SEO purposes and letting search engines know what your site is about. Then select Titles and H1 in the drop-off box. 6. The style of your page header with the title created it's time to give it a bit of style. Chances are you don't want to use basic style, as this will make your site look ancient. We will be making these changes with CSS. Typically, all elements of the style and display of your site will be monitored using this file. This will allow you to do things like change font sizes, create width and dimensions for certain site items, and a ton more. The first thing we'll do with your CSS file is changing the way your title looks. But first we need to create a CSS file. To do this, click on the title and you'll see a section of the title highlighted in blue. Click on the 'q' icon and enter #header in the box (this will give your title an ID that will allow you its appearance). Next, select Create a new CSS file. In the field that pops up, select 'Browse', select the folder you created earlier, where all your site's files are stored, and then call the file 'style.css', and click 'OK'. This file is where you will do all your design changes. Now with the CSS file we've created, we're going to create a selector. This allows you to make changes to the title text without changing the entire title. To do this, go to the DOM editor (bottom right corner) and select the H1 tag you created. Then select 'CSS Designer' in the top right corner. Next, click on the 'Selectors' option and the box must be automatically filled #header h1. Click Enter and you're all set. Now it's time to change the font. If you're not yet on the CSS Designer menu, then click on this tab again and select #header h1 you just created. Then there's the little box that says: Show set. Remove this box and you will unlock some interesting customization options. Feel free to play with these options as much as you want. You can change the font, font style, text size, alignment, add boundaries and more. Once you are satisfied with how your headline looks go to the next step. You can also click on the 'style.css' file at the top of the screen to see what the code looks like. 7. Add more content Chances you want your site to be a lot more than just a massive headline. Here's how you can add and style different text elements on the homepage. To add text to the page, click on the insert tab in the top right corner, and then select Paragraph. If you want to have a line gap between each paragraph, then you want to add a few paragraphs. As you'll notice in the image below there are a few paragraphs, along with a disordered list, aka bullet points. If you want to insert an orderly or disordered list into your page, select the Unordered List option, and then click on the tags in the code section. Finally, select the Item List section and add it between the two tags. Finally, we're going to go and add a header at the top of the page, right under the headline. To do this, find a section of code that ends, then click enter and create space. Next, select the header from the top right menu and select H2 from the fall window. You can then customize the title text as you see fit. 8. Add an image with a header and some basic content in place. It's time to add an image to your site to decorate things. Fortunately, with the stock image tool enabled, finding the right image shouldn't be too time consuming. You can use the built-in drain library by clicking on the CC Libraries tab and looking for an image. Or, you find your own images and upload them. For this tutorial, we chose later. If you're using an image from the Internet or your own collection, be sure to add it to the image folder you created earlier. Then select the Insert tab and select Image. Here you can find the image on your computer and then click Open. Now the software will automatically insert the image onto your page and add the correct code. 9. Preview your site Once you've collected your first version of the website it's time to see how it looks. Dreamweaver has a very useful built-in preview feature. This will allow you to see what your site looks like in various web browsers and mobile devices. This can help you catch any glaring errors before you decide to move to the next step and upload your site to your server. It's also a real-time preview, so any changes you make to your site will be shown automatically. To view the current version of your site, all you have to do is press the preview button in the bottom right corner. You can then choose which browser you would like to view your site in. You can also see what your site looks like on your mobile phone, taking pictures of the CD code. Make sure you check both the standard browser and mobile versions of your site before you decide to publish it online. Once you are satisfied with how your site looks and then continue on the final step. 10. Publish your site online with your main site to complete it it's time to upload it to your server. The process is quite simple and simple, but for this you will need to pre-purchase hosting. If you haven't done so yet, then spend some time browsing this list and sign up for the hosting provider of your choice. We recommend either Bluehost or Cloudways. Once you've signed up for the host, find the FTP information as you need it for the next step. With this taken care of, you can move on to the next step of actually downloading your site to your server. To do this, go to the site Site Management. In the window that comes to choose your site, then click on the pencil icon in the bottom left corner. Next, select the Servers option on the left side and click on the I icon, which allows you to add server information. All the information in this window is provided by your host, except for the server name field, it's up to you. Also, make sure you include the server's root directory and URL. This will make it so you can include on the site links from Dreamweaver that actually work. After setting up server information Save the save button and then click Save again. Now all you have to do is select the files you want to download from the left menu and tap an icon that looks like a fork in the top right corner. If you entered The server information is correct, then Dreamweaver will connect to the server and download your site's files to the specified location. That's it! You've successfully created and downloaded your very first Dreamweaver site. If you don't feel like creating an entire Dreamweaver site completely from scratch, then keep reading. Below, you'll see how you can use an existing template to simplify the process of building a website. How to use a Dreamweaver template to build your site If all of the above seemed pretty overwhelming then you can start with a website template as well. With one of the pre-made templates, you'll start and instead of creating everything from scratch, you can simply add or remove any pre-built items. It also gives you the advantage of seeing how the final design and codebase look side by side. What can help speed up your educational process. To do this, select the New, then Start Templates, Basic Layouts, and finally choose the style of the site you want to create. Here we went with the Main - Multi Column layout. You will find that this pattern gives you a lot to work with right out of the gate. We'll do some basic things like changing the name of the site and texting the title. To do this, we will follow a process similar to the one above. To change the title text, just click on the title element and enter the new text. To change the font, select a section of your code. Then, on the right side, click the I button next to Real Estate. Here you can change your font by selecting a text version that looks like capital 'T'. You can do the same with other items too. For example, you can change the type and size of fonts. Add an image to existing image blocks and more. But before we leave you to customize this template to your liking here's how you can quickly edit the background color of the header. You can take the approach above to customize the color with the 'CSS Designer' option. Or you can go directly to the CSS file. To do this, pay attention to the div class for this item, which is primary_header. Next, click on 'multiColumnTemplate.css' at the top of the page. Here we can change the background color of the title as soon as we find the primary_header element. Of course, there's a lot more that you can do when you're working with the template, but hopefully the changes above give you an idea of what you can do. After making the necessary changes to the site template, it's time to push the site to the server. Just follow the same process as steps 9 and 10 above. In Closing As You Can See Dreamweaver is an incredibly flexible website builder. With its easy-to-use user interface, and built-in editor You can build any website you want. From zltH1/gt: such a versatile tool that it is commonly used by beginners, all in the direction of advanced web developers. Above you learned how to understand the basics of Dreamweaver and get your very first site online. It's almost impossible to cover every aspect of Dreamweaver in one blog, but once you understand the basics it's up to you to continue your education. If you want to explore further there is a massive video tutorial library on Adobe's website you can explore. However, keep in mind that Dreamweaver is not the only tool that can be used to create a website. In fact, there are simpler methods that exist that use WordPress, and customize a beginner friendly theme. But, if you decide to create your website using Dreamweaver hope you are better equipped to get your site up and running in as little time as possible. Now to you. Have you used Dreamweaver to build your website? Any interesting tips or hacks you could add? Please share in the comments below.
