2005 chrysler town and country parts manual

Jupiterimages/Photos.com/Getty Images The Chrysler Town air conditioning system is a sealed system and should never leak refrigerant unless there is a leak in the system. If the refrigerant system in the air conditioning system is leaking or crashing, the air conditioning system must be recharged. Recharging any R134a air conditioning system does not require special certification, unlike the R12 Freon, but it requires a charging station to be sure that proper levels of refrigerant are reached. The actual charging process is relatively simple. Open the hood of the city and country and look at the back of the air conditioning compressor, the pulley-driven component at the bottom, the driver's side of the engine. Track the thicker of the two lines from the back of the compressor until you find a low pressure maintenance port, a metal valve sticking out of the line. Unscrew the plastic lid from the low-pressure service port and attach the blue fitting from the refrigerant charging station to this service port manually. Track the thinner hose from the back of the compressor until you find a service port, it's a high-pressure fitting. Connect the high-pressure hose from the refrigerant charging station to the high-pressure service port manually. Install a 34-ounce R134a charging machine if your city and country only have front air conditioning and 46 ounces if it has rear air conditioning. This process varies depending on the machine used, so refer to the machine's instructions. Start the city and country and turn on the air conditioning. Open the discharge and suction valves at the charging station and start the charging process when the machine alerts you, usually through the beep that the R134a is prepared. This process varies depending on each machine, refer to the machine's instructions for specifics. Listen to the beep indicating that the charging station has completed charging. Close both suction and discharge valves at the charging station. Open only the suction valve at the charging station so that any remaining R134a in the charging machine line enters the air conditioning system. Close the suction valve. Remove the charging station lines from the air conditioning lines in the city and country and screw the lids back to the service ports. Close the city and the hood of the country. A refrigerant charging station with R134a refrigerant charging station instructions Chrysler city and country minivan, which is the twin Dodge Caravan. It was introduced in 1990 with a V6 engine and wooden grain distinctives. If your city and country has problems with the launch, check the basics to diagnose the problem. Knowing what you are dealing with can help you decide if a mechanic should be called in to help. Find the battery and look at the connections. Battery under the hood on the driver's side. Connections with c should not be free and should not have corrosion. If they are free, tighten the wrench. For corrosion, pour the soda over the terminals (carbonation will help to dampen corrosion) and scrub with wire brush. Turn the key in the ignition lock into on position. Turn on wipers or internal lights to check if the battery is working. If the wipers or lights do not light up, the battery may be dead and needs to be replaced. Battery life usually lasts between two and three years. If the wipers move slowly or the light seems dim, you may be able to simply recharge the battery. If the recharge does not work, the alterator does not send enough energy to the battery and will need a check. Your local auto parts store has a diagnostic tool that can check if the alterator and starter are working properly. Remove the ignition candle from the engine of your city and country. Check the ignition candle for corrosion and remove with a wire brush. Place the ignition candle wire on the metal part of the engine. Crank your car and someone look at the blue spark. Make sure you have a signal in place so that your assistant can alert you to turn off the car. No spark indicates that your ignition candle is not working properly, which means that your engine will not ignite properly. Replace the ignition candles. Turn the key in the ignition to start the city and country and listen to any noises that the engine may emit. Clicking noise may indicate a faulty starter. No noise can be a sign of an ignition problem. Knocking noise can indicate fuel shortages or other problems with your fuel system such as fuel line, fuel filter, or fuel pump. Add a gallon of gas. Turn the key to the position turn on several times when you click on the accelerator. This helps to use the fuel pump. Although the city and the country has a fuel sensor, it can be faulty at times. For owners of city and country vans made between 2008 and 2010 call 1-800-488-0359 to check if your car is affected by the recall. Under certain conditions, the tire can carry a hole in the fuel filling pipe. This can lead to a leak and can even lead to a fire. Photo courtesy of Bull-Doser on Wikimedia.org. The next steps will help you keep your Chrysler Town and Country model in good condition. The time and mile maintenance intervals presented here are based on the average vehicle use of 12,000 miles per year, but you can adjust these intervals to reflect the operating frequency and condition of your vehicle. For example, if you use your city and country every day on short trips, at low speed and with frequent stops, the engine will require more attention than You drive regularly over 10 miles, between 40 and 60 mph with very few stops. Help your engine work at its best. Let's go. Check the ignition system. Make sure the insulation on the ignition candle wires is in good condition and replace the wires every three three Also, replace the ignition candles every 18 or 24 months and distributor the cover and rotor each year to provide the proper spark for the combustion chamber. Check and adjust the ignition time each year - on some models, the time is controlled by the vehicle's computer and is not regulated (refer to the owner's guide). Check the charging system. Clean the battery terminals and cables every three months and make sure the electrical connections with the alterator and starter are dense and in good condition. Examine and adjust the drive belts of the alterator and air compressor every three months. Replace the drive straps at least every two years or whenever there are signs of glazing, cracking and wear. Examine the cooling system. Check the level of coolant, radiator hoses and the condition of the radiator cover each month. Replace the cooling every two years. If you live in a region with winter frosts, replace the coolness every autumn. Examine the fuel and emissions system. If the Town and Country model is equipped with an air pump, check and adjust the strap voltage every three months. Clean the cranked respite cabinet, check the PCV valve, and replace the air and fuel filters every year. Check the automatic transmission every month. Heat the engine, move the gear selector through each position and back to the park. When the engine is running and the parking brake is applied, check the transmission oil level. Add the transmission oil as needed. Change the engine oil and filter every three months or every 3,000 miles. Check the braking system every month. Make sure the brake fluid in the main tank of the cylinder is on the right lever and add the recommended liquid if necessary. Replace the brake fluid every two years. When checking the brake pads and shoes make sure that the lining is thicker than the back plate, otherwise replace them. Check the steering system every three months. The power steering fluid in the tank should be at the proper level. Examine the tension of the drive belt and look for signs of glazing, cracking and wear. Replace every two years or whenever there are signs of wear. Consult with a car maintenance guide to identify and find components on your Chrysler city and country. You can buy a service guide at most auto parts stores or consult one for free at the public library.
