Other unpredictable or unknown factors not discussed in this report may also have a significant negative impact on forward-looking statements. Chevron's strategic and business planning processes combine the company's views on the energy market environment for executive decision management management and facilitating discussions with the Board of Directors. The energy needs of the world are higher today than at any time in human history. Most energy experts agree that oil and gas will account for about half of the world's energy consumption for at least the next two decades under almost any market scenario, even as government policies increasingly aim to reduce GHG emissions. With the decline in production from existing sources, the world will need significant investments in oil and gas projects to meet the demand for affordable, reliable and increasingly clean energy. As part of our strategic planning process, we use our own models to predict demand, energy conservation, supply, commodity prices and carbon prices, which include assumptions about future policy changes, such as those that may be implemented in support of the Paris Agreement. Agreement.
