Author Rui Pinto 11 mai 2012.Q: Relation between fixed point and limit point Does every metric space have at least one fixed point, limit point, or neither? I am trying to work through an example in my book to prove this question, but I can't quite wrap my head around it. A: HINT: If x is a fixed point, then x is a cluster point of the empty set, so x is not a limit point. If x is a limit point, then x is a cluster point of any sequence of points that converges to x . To prove this, suppose that x is not a limit point. Then U is an open nbhd of x and there is a sequence (y_n) of points of U such that $y_n \not\rightarrow x$. If x is a fixed point, then there is a n such that $y_n = x$, and that contradicts the fact that x is not a limit point. Q: Simple display of values in the list is not working in my code I have a list of string variables. I am trying to display them in the console but its not working. Here is my code: public static void Main() { var data = new List(); data.Add("abc"); data.Add("pqr"); // data.Add(3.4); var min = data.Min(); var max = data.Max(); foreach (var x in data) {
